

Q: What is the repeatability of the autofocus?

A: Examples of the repeatability of the autofocus are shown below.

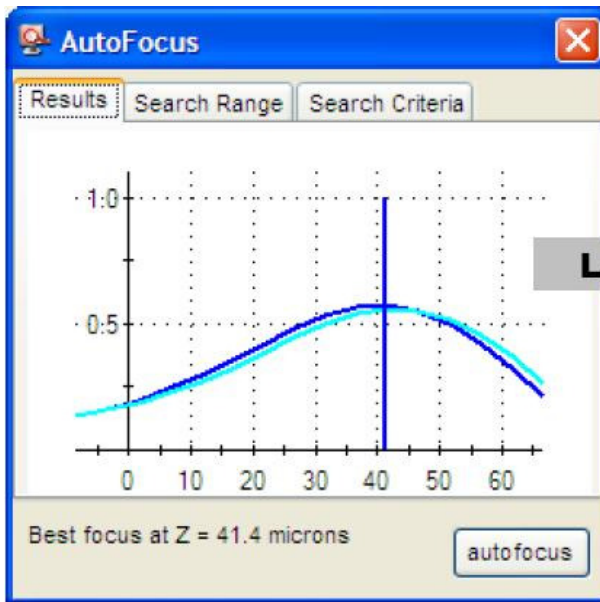

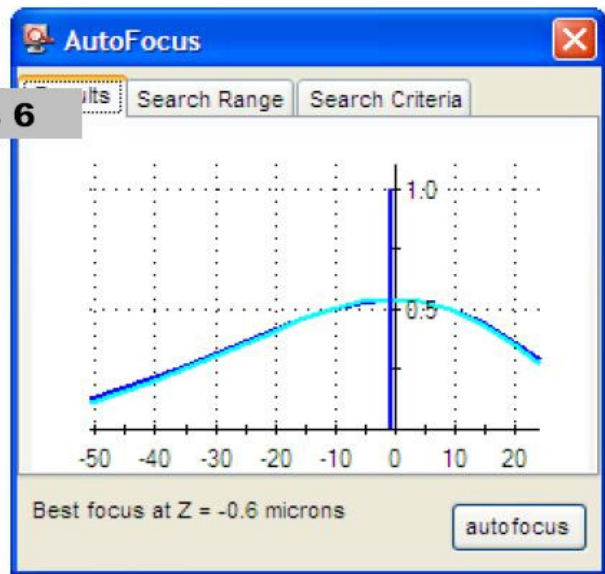

The two images on each line are simple re-tests. In other words, they are the results of just pressing the “autofocus” button twice. The lens was then removed, and replaced with the other lens. The process was then repeated.

There is about 40 microns variation between lens 6 and lens 7, but both lenses repeat to better than 1 micron, even when removed and reloaded.

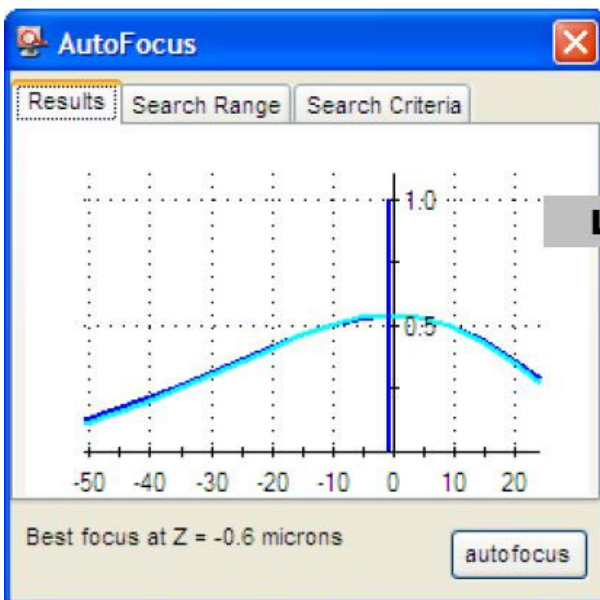

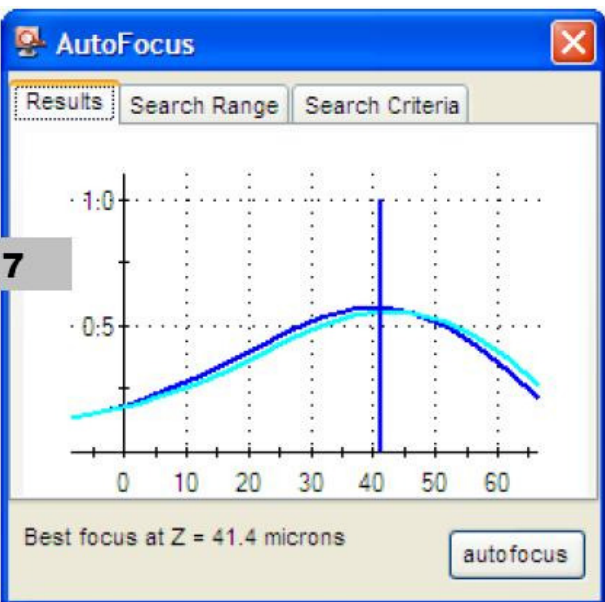

Lens 6

Lens 7
